Nine common network devices

CONCEPT

📖 WHAT TO READ & DISPLAY ON SCREEN

Network devices connect hosts, carry signals, forward data, or enforce access rules. A single product can combine several functions, so its behavior matters more than its shape.

- Network Interface Card (NIC): provides a host network interface.
- Hub: repeats incoming bits to other ports without learning Media Access Control (MAC) destinations.
- Switch: learns Media Access Control (MAC) information and forwards local-link frames.
- Router: forwards Internet Protocol (IP) packets between networks using routes.
- Modem: adapts signals for a provider access technology.
- Wireless access point: bridges Wi-Fi stations onto a Local Area Network (LAN).
- Repeater: regenerates or retransmits signals.
- Bridge: joins link-layer segments; a switch is a multiport bridge.
- Firewall: permits or blocks traffic according to policy.

💡 BRIEF EXPLANATION AFTER READING (TEACHER'S DISCUSSION NOTES)

🌟 REAL-WORLD ANALOGY / INTUITION

❓ QUICK CHECK FOR UNDERSTANDING (ASK THE CLASS)

Teacher Asks: "Ask the class: Why is this concept essential when setting up or troubleshooting a modern network?"

Expected Answer / Guidance: Encourages learners to explain the functional role and real-world impact of nine common network devices.

Key Takeaway: Network devices connect hosts, carry signals, forward data, or enforce access rules. A single product can combine several functions, so its behavior matters more than its shape.

Network Interface Card (NIC)

CONCEPT

📖 WHAT TO READ & DISPLAY ON SCREEN

A Network Interface Card provides the physical connection and hardware Media Access Control (MAC) address that allows a computer to send and receive frames on a local link.

- Physical connection: Houses the physical port (such as Registered Jack 45 (RJ45) or Wi-Fi radio) and controller chip for host communication.
- Unique hardware identity: Permanently assigned a factory-burned 48-bit Media Access Control (MAC) address for local link delivery.
- Data transmission: Converts host memory data into electrical or radio bitstreams, framing data with Media Access Control (MAC) addresses and CRC checksums.

Teacher Asks: "Ask the class: Why is this concept essential when setting up or troubleshooting a modern network?"

Expected Answer / Guidance: Encourages learners to explain the functional role and real-world impact of network interface card (nic).

Key Takeaway: A Network Interface Card provides the physical connection and hardware Media Access Control (MAC) address that allows a computer to send and receive frames on a local link.

Slide 5 of 22

Network Hub

CONCEPT

📖 WHAT TO READ & DISPLAY ON SCREEN

A network hub is a legacy Layer 1 multiport repeater that blindly broadcasts incoming electrical signals out all other ports, creating a shared collision domain.

- Multiport repeater: Connects multiple twisted-pair Ethernet cables in a single shared electrical bus.
- No address awareness: Operates purely at Layer 1; it cannot read Media Access Control (MAC) addresses, Internet Protocol (IP) packets, or inspect frames.
- Broadcast behavior: Any electrical bit received on one port is broadcast out to every other port, creating a single shared collision domain.

💡 BRIEF EXPLANATION AFTER READING (TEACHER'S DISCUSSION NOTES)

Key Takeaway: A network hub is a legacy Layer 1 multiport repeater that blindly broadcasts incoming electrical signals out all other ports, creating a shared collision domain.

Slide 6 of 22 **Network Switch** CONCEPT

📖 WHAT TO READ & DISPLAY ON SCREEN

A network switch is an intelligent Layer 2 device that learns Media Access Control (MAC) addresses on each port to forward frames directly to their intended destination.

- Dedicated bandwidth: Connects local hosts with dedicated point-to-point links, eliminating collisions between ports.
- Media Access Control (MAC) address table: Dynamically inspects the source MAC of incoming frames and maps each address to its incoming physical port.
- Forwarding decision: When a frame arrives, the switch forwards known unicast directly to the target port; only unknown destinations are flooded.

💡 BRIEF EXPLANATION AFTER READING (TEACHER'S DISCUSSION NOTES)

Key Takeaway: A network switch is an intelligent Layer 2 device that learns Media Access Control (MAC) addresses on each port to forward frames directly to their intended destination.

Slide 7 of 22

Network Router

CONCEPT

📖 WHAT TO READ & DISPLAY ON SCREEN

A router is a Layer 3 internetworking device that uses routing tables to forward Internet Protocol (IP) packets across different networks and broadcast domains.

- Network boundary: Separates distinct broadcast domains and connects local subnets to WANs or the global Internet.
- Routing table: Maintains a table of network destination prefixes, next-hop Internet Protocol (IP) addresses, and outgoing interfaces.
- Packet forwarding: Reads destination Internet Protocol (IP) headers, decrements the Time to Live (TTL), determines the best path, rewrites the Layer 2 frame, and forwards.

💡 BRIEF EXPLANATION AFTER READING (TEACHER'S DISCUSSION NOTES)

Key Takeaway: A router is a Layer 3 internetworking device that uses routing tables to forward Internet Protocol (IP) packets across different networks and broadcast domains.

Slide 8 of 22

Modem (Modulator-Demodulator)

CONCEPT

📖 WHAT TO READ & DISPLAY ON SCREEN

A modem converts digital computer pulses into analog signals for provider transmission lines, adapting local Ethernet to external provider media.

- Media adaptation: Bridges home or office Ethernet to provider infrastructures like telephone lines (Digital Subscriber Line (DSL)), cable (DOCSIS), or fiber (ONT).
- Modulation & demodulation: Modulates outgoing digital square waves into analog carrier frequencies and demodulates incoming analog waves back to bits.
- Signal conversion: Local Area Network (LAN) Ethernet packets enter the modem, are modulated onto high-frequency RF carriers over coaxial or copper cables, and reach the ISP headend.

💡 BRIEF EXPLANATION AFTER READING (TEACHER'S DISCUSSION NOTES)

Key Takeaway: A modem converts digital computer pulses into analog signals for provider transmission lines, adapting local Ethernet to external provider media.

Slide 9 of 22

Wireless Access Point (AP)

CONCEPT

📖 WHAT TO READ & DISPLAY ON SCREEN

A wireless access point bridges radio frequency signals from Wi-Fi client stations onto a wired Ethernet local area network.

- Radio transceiver: Transmits and receives radio waves across 2.4 GHz, 5 GHz, or 6 GHz frequency bands.
- Layer 2 bridge: Bridges IEEE 802.11 wireless frames into IEEE 802.3 wired Ethernet frames without changing Internet Protocol (IP) addresses.
- Client bridging: Broadcasts an Service Set Identifier (SSID) beacon, authenticates wireless client devices, and transparently forwards their traffic to the wired switch via PoE uplink.

💡 BRIEF EXPLANATION AFTER READING (TEACHER'S DISCUSSION NOTES)

Key Takeaway: A wireless access point bridges radio frequency signals from Wi-Fi client stations onto a wired Ethernet local area network.

Slide 10 of 22 **Network Repeater** CONCEPT

📖 WHAT TO READ & DISPLAY ON SCREEN

A repeater regenerates and retimes attenuated signals at the physical layer, extending the effective reach of a network cable or wireless link.

- Overcoming attenuation: Counteracts signal loss and cable resistance that degrade data beyond standard maximum run lengths.
- Signal regeneration: Rather than merely amplifying noise, a digital repeater reconstructs clean, full-voltage digital pulses.
- Signal restoration: Listens on an input interface, cleans and retimes the incoming waveform, and retransmits it at full strength across the extended medium segment.

Slide 11 of 22

Network Bridge

CONCEPT

📖 WHAT TO READ & DISPLAY ON SCREEN

A network bridge joins two physical Local Area Network (LAN) segments at Layer 2, filtering local traffic to isolate collisions while forwarding necessary inter-segment frames.

- Traffic segmentation: Divides a busy network into two smaller collision domains while keeping them in the same subnet.
- Filtering table: Maintains a list of Media Access Control (MAC) addresses on Segment A and Segment B to decide whether traffic needs to cross.
- Frame filtering: If sender and receiver are on Segment A, the bridge filters (drops) the frame from crossing; if the target is on Segment B, it forwards it across.

Slide 12 of 22 **Network Firewall** CONCEPT

📖 WHAT TO READ & DISPLAY ON SCREEN

A firewall enforces security policies at network boundaries, inspecting packet headers and connection states to permit authorized traffic and block threats.

- Security perimeter: Sits at network boundaries (e.g. between Local Area Network (LAN) and Internet) or as host software to defend against unauthorized access.
- Inspection methods: Uses packet filtering (Internet Protocol (IP)/ports), stateful inspection (tracking active connections), or deep packet inspection (DPI).
- Policy enforcement: Inspects packet headers against security rules; permitted traffic (e.g. outbound web) is passed, while unauthorized packets are dropped or rejected.

How Interfaces and Switches Connect Local Devices

CONCEPT

📖 WHAT TO READ & DISPLAY ON SCREEN

A network interface lets a host send and receive data on a link. A switch connects local links and uses learned hardware addresses to forward Ethernet frames.

- A hub repeats incoming bits out its other ports; it does not learn destination Media Access Control (MAC) addresses.
- A switch learns source Media Access Control (MAC) addresses and forwards known unicast frames toward the learned destination port. Unknown destinations are flooded within the Virtual Local Area Network (VLAN).
- A bridge joins Local Area Network (LAN) segments at layer 2. A switch is effectively a multiport bridge.

Routers, Access Points, and Modems

CONCEPT

📖 WHAT TO READ & DISPLAY ON SCREEN

A router forwards packets between networks, while an access point connects wireless devices to a local network. A modem or optical terminal supports the provider's access technology.

- A modem adapts signals for a provider access technology, such as cable or Digital Subscriber Line (DSL). An optical network terminal serves a fiber access role.
- A wireless access point bridges Wi-Fi clients onto a Local Area Network (LAN). An AP alone is not necessarily a router.
- A repeater regenerates or retransmits signals. It does not choose Internet Protocol (IP) routes. Home gateways often combine router, switch, Access Point (AP), Dynamic Host Configuration Protocol (DHCP), and firewall functions.

Example: Switch vs Router Roles

EXAMPLE

📖 WHAT TO READ & DISPLAY ON SCREEN

A local printer and a remote website require different delivery paths. The switch connects local devices, while the router handles forwarding toward another network.

- Local print traffic travels from the computer through the switch to the printer.
- Traffic to a remote network goes through the switch to the router, which chooses an appropriate next hop.

Interfaces, Link Lights, and Firewalls

CONCEPT

📖 WHAT TO READ & DISPLAY ON SCREEN

An interface connects a device to a network, while a firewall controls permitted traffic. A working link indicator confirms only part of the connection and does not prove Internet or application access.

- Local Area Network (LAN) ports usually connect local clients; a Wide Area Network (WAN) interface connects toward another network/provider. Check the actual model's labels.
- A firewall permits or blocks traffic according to policy. It is not a guarantee that all allowed traffic is safe.
- Link lights show physical/link status, not proof of correct Internet Protocol (IP) settings, Domain Name System (DNS), or Internet service.

VLAN Concepts and Routing Principles

CONCEPT

📖 WHAT TO READ & DISPLAY ON SCREEN

Virtual LANs divide a single physical switch into isolated logical broadcast domains, while routers connect them using static or dynamic routing rules.

- Virtual Local Area Network (LAN) (Virtual Local Area Network (VLAN)): Divides one physical switch into multiple separate logical broadcast domains (e.g., VLAN 10 for Students, VLAN 20 for Faculty).
- Broadcast Isolation: Broadcast traffic (such as Address Resolution Protocol (ARP) and Dynamic Host Configuration Protocol (DHCP)) stays confined inside its assigned Virtual Local Area Network (VLAN), boosting performance and security.
- Inter-VLAN Routing: Because devices in different VLANs cannot communicate directly, all inter-VLAN traffic must pass through a router or Layer 3 switch.
- Static Routing: A network administrator manually enters fixed destination routes into the router table (simple, predictable, low overhead for small networks).
- Dynamic Routing: Routers automatically discover paths and exchange network routes using protocols like OSPF and RIP (automatically updates if a link fails).

Expand a small office

APPLICATION

📖 WHAT TO READ & DISPLAY ON SCREEN

Additional wired endpoints need enough switch ports, while weak wireless coverage may need a better-placed access point. Adding the right function is more useful than adding another box without checking the existing network.

- Add a suitable switch for Ethernet ports and an Access Point (AP) with a wired uplink for wireless coverage.
- Use a router for traffic between networks, rather than buying another hub.
- Check existing gateway features before adding duplicate Dynamic Host Configuration Protocol (DHCP) servers.

Device Roles Along a Network Path

WALKTHROUGH

📖 WHAT TO READ & DISPLAY ON SCREEN

A request can pass through several devices, each performing a different job. Interfaces, switching, routing, and provider access work together without being interchangeable functions.

- The Personal Computer (PC) Network Interface Card (NIC) sends a frame through an Ethernet port to a switch. Link indicators show link detection, not proof of Internet Protocol (IP) or Internet access.
- The switch forwards a known local unicast toward its learned destination port. A hub would repeat incoming bits to other ports.
- For a remote Internet Protocol (IP) network, a router selects the next hop. Its Local Area Network (LAN) and Wide Area Network (WAN) interfaces face different network roles.
- A home gateway may also contain an Access Point (AP), switch, Dynamic Host Configuration Protocol (DHCP) service, Network Address Translation (NAT), and firewall. A modem or optical terminal serves the provider access technology.
